

# Oncologist Makes Ground-Breaking Discovery: How To Cure Cancer With Baking Soda

[July 9, 2016Admin](#)

Tulio Simoncini is a former Italian oncologist from Rome who came up with a theory that every cancer is result of fungus known as *Candida albicans*.

*“Cancer is a fungus, named *Candida albicans*, and it can be cured with sodium bicarbonate”.*

The treatment is quite simple. Tulio claims that the organism and the tumor must be alkalized and this can be achieved with one inexpensive and affordable ingredient. Sodium bicarbonate is very effective in the fight against *Candida*, diminishing the tumor and disabling metastases.

**Acid body, sodium bicarbonate, *Candida*, beneficial bacteria and cancer**

Tulio's effort is based on four theoretical elements:

- Acidic bodies, because of the fact that they are linked with health problems and cancer.

- Alkalize your body with sodium bicarbonate, since it has been used as antacid which is ingestion assistance in numerous preparations. It is very cheap and you can find a small pot of this ingredient for around \$2 per pound in the grocery stores.
- Your intestines are habitat for beneficial bacteria which direct 85% of your immunoreactions, to release anti-cancer vitamins such as biotin, B-12, folic acid and vitamin K from your foods and even to create a compound named sodium butyrate which makes the cancer cells to destroy themselves. Beneficial bacteria's function is disturbed when the acidity of the gut raises.
- The beneficial bacteria is the first line of defense. While sleeping, the beneficial bacteria digest the microbes, fungus and yeasts you have consumed during the day. In fact, the ideal food for beneficial bacteria is the yeast or fungus, *Candida albicans*. **Candida and cancer**

*Candida* is anaerobe and it requires oxygen in order to produce energy. When *Candida* is in the bloodstream it colonizes particular area in the organism and lowers the oxygen levels in that area significantly. The local cells don't die, instead they change their energy generation from an oxygen-based system to one that doesn't use oxygen.

Cancer cells do not require oxygen in order to produce their own energy from the food molecules, so they use this system. Actually, Otto Warburg won a Nobel Prize back in 1931 for explaining the world this characteristic of the cancer cells and that oxygen is their true enemy!

*Candida Albicans* is able to escape the intestine and move around the organism through the bloodstream. You can eliminate the yeast from the bloodstream with oregano oil and cinnamon. 25% of type-2 Diabetics improved their condition after taking cinnamon.

This is because the fungus stays on the external linings of cells, disabling the vital receptor sites- in case of diabetes the insulin receptor sites are affected.

In addition, *Candida* also creates waste product similar to sugar, so patients with increased blood sugar levels are more vulnerable to cancer without too much chances for survival.

According to the results from a research released in Cancer Watch, women who used antibiotics more than 25 times in their life had 100% more risk for breast cancer.

Their immune systems were weakened because of the illnesses treated with antibiotics. Moreover, their levels of beneficial bacteria were lowered which is good for the Candida, having more chances for surviving in the gut and then enter the bloodstream.

Tulio was acknowledged Italian Oncologist who came up with this theory that every cancer is a result of the fungus named Candida Albicans.

He also stated that the solution for cancer is alkalizing the body which will disable the Candida. The most important thing is that everyone can do this with the help of baking soda which is very cheap ingredient.

But he was struck off in his own country. He recommended a cheap ingredient as very effective in the fight against cancer, and still he was struck off. However, his efforts in this field are acknowledged all around the world.
